

Thawte SSL EV – Extended Validation

Extended validation certificates (EV) benefit from the highest trust level from web users.

Those certificates activating the green URL bar on most of web browsers help increase online sales rate (+16%) and decrease cart abandonment rate (up-to 30%).

They efficiently protect companies from identity theft, spreading on the internet.

trust booster

TBS INTERNET was founded in 1996 by IT security specialists to help companies comply with encryption best practices. Customers include leading companies, value-added resellers and public sectors.

Since the early days, TBS INTERNET offered a highly professional service issuing as well as installing digital certificates for its clients. As Internet usage grew and companies began to require specialized online security, it was the first to create a multi-brand digital certificate platform, securing platinum partnerships with major SSL providers.

Thanks to its own certification authority "TBS X509" the company can provide competitive authenticated certificates very well supported in browsers.

Founded in 1995, Thawte was the first certification authority to issue SSL certificates outside of the United States.

Its international success was great and was purchased by Verisign in 2001 and then Symantec. It has recently joined forces into the DigiCert Corporation as part of the Symantec Website Security activity.

the trust seal

Equipment

Any kind of server
 Any kind of browser

Functionalities

Full authentication of the website and its owner
 Data encryption between a client and a server
 Green URL bar activation

Technical information

Cipherment: up-to 256-bit
 Installable on an unlimited number of machines
 Standard : X509v3, SSLv3, TLS, chained, SHA256
 Delivery time : 7 business days
 Lifetime 1 or 2 years
 Free lifetime reissue
 Possibility to add SANs – Compliant with Microsoft UCC standard
 Trust seal display
 6-factor audit (anti-phishing), performed by professionals
